Mass-gap for black hole formation in higher derivative and ghost free gravity
arXiv:1505.00492

Sven Köppel

Overview

Applications to special cases

Point-Source solution

The mass gap for mini black hole production

In this section

Presenting the more readable results from Biswas, Gerwick, Koivisto, Mazumdar (arXiv:1110.5249, arXiv:1302.0532)

Linearized gravity $g_{\mu\nu} = \eta_{\mu\nu} + h_{\mu\nu}$. The most general **quadratic** action:

$$S_q = \int d^4x \sqrt{-g} R_{\mu_1\nu_1\lambda_1\sigma_1} \mathcal{D}_{\mu_2\nu_2\lambda_2\sigma_2}^{\mu_1\nu_1\lambda_1\sigma_1} R^{\mu_2\nu_2\lambda_2\sigma_2}$$

with $\mathcal{D} \supset \{\eta_{\mu\nu}, \nabla_\mu\}$.

$$\begin{aligned}
S_q = & \int d^4x \sqrt{-g} \left[RF_1(\square)R + RF_2(\square)\nabla_\mu\nabla_\mu R^{\mu\nu} + R_{\mu\nu}F_3(\square)R^{\mu\nu} + R_\mu^\nu F_4(\square)\nabla_\nu\nabla_\lambda R^{\mu\lambda} \right. \\
& + R^{\lambda\sigma}F_5(\square)\nabla_\mu\nabla_\sigma\nabla_\nu\nabla_\lambda R^{\mu\nu} + RF_6(\square)\nabla_\mu\nabla_\nu\nabla_\lambda\nabla_\sigma R^{\mu\nu\lambda\sigma} + R_{\mu\lambda}F_7(\square)\nabla_\nu\nabla_\sigma R^{\mu\nu\lambda\sigma} \\
& + R_\lambda^\rho F_8(\square)\nabla_\mu\nabla_\sigma\nabla_\nu\nabla_\rho R^{\mu\nu\lambda\sigma} + R^{\mu_1\nu_1}F_9(\square)\nabla_{\mu_1}\nabla_{\nu_1}\nabla_\mu\nabla_\nu\nabla_\lambda\nabla_\sigma R^{\mu\nu\lambda\sigma} \\
& + R_{\mu\nu\lambda\sigma}F_{10}(\square)R^{\mu\nu\lambda\sigma} + R_{\mu\nu\lambda}^\rho F_{11}(\square)\nabla_\rho\nabla_\sigma R^{\mu\nu\lambda\sigma} \\
& + R_{\mu\rho_1\nu\sigma_1}F_{12}(\square)\nabla^{\rho_1}\nabla^{\sigma_1}\nabla_\rho\nabla_\sigma R^{\mu\rho\nu\sigma} + R_\mu^{\nu_1\rho_1\sigma_1}F_{13}(\square)\nabla_{\rho_1}\nabla_{\sigma_1}\nabla_{\nu_1}\nabla_\nu\nabla_\rho\nabla_\sigma R^{\mu\nu\lambda\sigma} \\
& \left. + R^{\mu_1\nu_1\rho_1\sigma_1}F_{14}(\square)\nabla_{\rho_1}\nabla_{\sigma_1}\nabla_{\nu_1}\nabla_{\mu_1}\nabla_\mu\nabla_\nu\nabla_\rho\nabla_\sigma R^{\mu\nu\lambda\sigma} \right].
\end{aligned}$$

Confining the Lagrangian: 14 Terms \rightarrow 3 Terms

- ▶ Using the antisymmetric properties of the Riemann tensor,

$$R_{(\mu\nu)\rho\sigma} = R_{\mu\nu(\rho\sigma)} = 0$$

- ▶ and the Jacobi identity

$$\nabla_{\alpha} R_{\mu\nu\beta\gamma} + \nabla_{\gamma} R_{\mu\nu\beta\alpha} + \nabla_{\beta} R_{\mu\nu\gamma\alpha}$$

Making 8 terms in GR.

- ▶ Linearizing: ∇_{μ} commute on Minkowski throwing out 3 terms due to symmetry

Point-Source solution

The mass gap for mini black hole production

Confining the Lagrangian: 3 Terms

Linearized Action:

$$S_q = \int d^4x \left[R F_1(\square) R + R_{\mu\nu} F_3(\square) R^{\mu\nu} + R_{\mu\nu\lambda\sigma} F_{10}(\square) R^{\mu\nu\lambda\sigma} \right]$$

can be casted in terms of $h_{\mu\nu}$ by expressions like

$$R_{\mu\nu\lambda\sigma} = \frac{1}{2}(\partial_{[\lambda}\partial_{\nu}h_{\mu\sigma]} - \partial_{[\lambda}\partial_{\mu}h_{\nu\sigma]}), \dots, R = \partial_{\nu}\partial_{\mu}h^{\mu\nu} - \square h$$

yielding eq. (1) from the Frolov paper:

$$S_q = - \int d^4x \left[\frac{1}{2} h_{\mu\nu} \square a(\square) h^{\mu\nu} + h_{\mu}^{\sigma} b(\square) \partial_{\sigma} \partial_{\nu} h^{\mu\nu} + hc(\square) \partial_{\mu} \partial_{\nu} h^{\mu\nu} \right. \\ \left. + \frac{1}{2} h \square d(\square) h + h^{\lambda\sigma} \frac{f(\square)}{\square} \partial_{\sigma} \partial_{\lambda} \partial_{\mu} \partial_{\nu} h^{\mu\nu} \right]$$

Applications to special cases

The most general action

$$S_q = - \int d^4x \left[\frac{1}{2} h_{\mu\nu} a(\square) h^{\mu\nu} + h_{\mu}^{\sigma} b(\square) \partial_{\sigma} \partial_{\nu} h^{\mu\nu} + hc(\square) \partial_{\mu} \partial_{\nu} h^{\mu\nu} \right. \\ \left. + \frac{1}{2} h \square d(\square) h + h^{\lambda\sigma} \frac{f(\square)}{\square} \partial_{\sigma} \partial_{\lambda} \partial_{\mu} \partial_{\nu} h^{\mu\nu} \right]$$

GR Field equations can be used to show

$$b = 0, \quad c + d = 0, \quad b + c + f = 0,$$

with only two independent functions.

Applications to special cases

General Relativity (GR)

Recover GR in **infrared** domain

$$S_q = - \int d^4x \left[\frac{1}{2} h_{\mu\nu} \square a(\square) h^{\mu\nu} + h_{\mu}^{\sigma} b(\square) \partial_{\sigma} \partial_{\nu} h^{\mu\nu} + hc(\square) \partial_{\mu} \partial_{\nu} h^{\mu\nu} \right. \\ \left. + \frac{1}{2} h \square d(\square) h + h^{\lambda\sigma} \frac{f(\square)}{\square} \partial_{\sigma} \partial_{\lambda} \partial_{\mu} \partial_{\nu} h^{\mu\nu} \right]$$

with $a(0) = c(0) = -b(0) = -d(0) = 1$ gives $\mathcal{L} = R$

Applications to special cases

Gauss-Bonnet (GB)

- ▶ Gauss-Bonnet term $\mathcal{G} = R^2 - 4R_{\mu\nu}R^{\mu\nu} + R_{\mu\nu\alpha\beta}R^{\mu\nu\alpha\beta}$
- ▶ is a special case with $a = c = 1$, so that $\mathcal{L} = R + \alpha(\square)\mathcal{G}$.
- ▶ (Interesting only in $D \geq 4 + 1$ dimensions).

Point-Source solution

The mass gap for mini black hole production

$$a = c = \exp(-\square/\mu^2)$$

equal to NCG (Noncommutative Geometry) / NCBH (Noncommuting Black Holes), and similar to GUP.

- ▶ Start with point-source Energy-momentum tensor

$$\tau_{\mu\nu} = \rho \delta_{\mu}^0 \delta_{\nu}^0 = m \delta^3(\vec{r}) \delta_{\mu}^0 \delta_{\nu}^0$$

- ▶ Compute metric in Newtonian limit

$$ds^2 = -(1 + 2\Phi)dt^2 + (1 - 2\Psi)dx^2$$

by solving EFE (eg. geometric part:)

$$-\kappa \tau_{\mu}^{\mu} \tau_{\nu}^{\mu} = 0 = (a+b) \square h_{\nu,\mu}^{\mu} + (c+d) \square \partial_{\nu} h + (b+c+f) h_{,\alpha\beta}^{\alpha\beta}$$

- ▶ Yields equations

$$2(a - 3c)[\nabla^2 \Phi - 4\nabla^2 \Psi] = \kappa \rho$$

$$2(c - a)\nabla^2 \Phi - 4c\nabla^2 \Psi = -\kappa \rho.$$

“We seek functions $c(\square)$ and $a(\square)$, such that there are no ghosts and no $1/r$ divergence at short distances”

With $f = 0$ (\Leftrightarrow non higher derivative theory),

$$4a(\nabla^2)\nabla^2\Phi = 4a(\nabla^2)\nabla^2\Psi = \kappa\rho = \kappa m\delta^3(\vec{r})$$

- ▶ For instance $a(\square) = e^{-\square/M^2}$ like in String theory
- ▶ Fourier transformation of eq (\Uparrow) gives

$$\Phi(r) \sim \frac{m}{M_p^2 r} \int \frac{dp}{p} e^{-p^2/M^2} \sin(pr) = \frac{m\pi}{2M_p^2 r} \operatorname{erf}\left(\frac{rM}{2}\right)$$

- ▶ Error function $\lim_{r \rightarrow \infty} \operatorname{erf}(r) = 1$ is GR limit
- ▶ Error function $\lim_{r \rightarrow 0} \operatorname{erf}(r) = r$ makes Newtonian potential $\Phi(r) \sim mM/M_p^2$: **Finite potential!**
- ▶ **Frolov**: “A finite solution is not necessary regular one”; reproduces solution.

Evaluation

The result $\Phi(r)$ is nothing new! The same linearized gravity solution with

$$\operatorname{erf}\left(\frac{rM}{2}\right) = \gamma\left(1/2; \left(\frac{rM}{2}\right)^2\right) \equiv \gamma(1/2; r^2/4\theta)$$

has already been done by Nicolini 2005

(arXiv:hep-th/0507266), where $\theta = 1/M$ is the NCBH fundamental length and therefore M is the minimal length.

The same result was also recovered in 2005 by Gruppiso (arXiv:hep-th/0502144) with the erf representation. None of them were cited by Biswas, Gerwick, Koivisto, Mazumdar 2011 (arXiv:1110.5249).

arXiv:1505.00492

Sven Köppel

- ▶ Object of investigation: Collapsing spherical thin null shell.
- ▶ To do so: Boost point source along y -axis with constant ultrarelativistic velocity β . After comoving transformation $(t, y) \rightarrow (v, u)$, the field is found as

$$\Phi = -4GM F(\zeta_{\perp}^2) \delta(u)$$
$$F(z) = \int_0^{\infty} \frac{ds}{s} f(s) e^{-z/(4s)}$$

- ▶ Remember: Only HD/GF gravity has $f \neq 0$. For example in GF gravity,

$$F(z) \sim z - \frac{1}{4}z^2 + O(z^3) \quad (1)$$

Sven Köppel

- ▶ Author considers ominous set of photons added to the spacetime: $ds^2 = ds_0^2 + \langle dh^2 \rangle$
- ▶ Determine the position of an **apparent horizon** by

$$0 = (\nabla g_{\theta\theta})^2 = \left(\nabla\left(r^2 - \frac{GM}{r}zF(z)\right)\right)^2$$

- ▶ Find: For small enough mass M there is no apparent horizon! \rightarrow Mass gap for mini-black hole production.
- ▶ Funnily: “The divergence is a result of the **unphysical assumption, that the thickness of the null shell is zero**, and for the collapse of the shell with finite thickness this divergence becomes softer or is absent.”

Evaluation

In comparison with our models, eg. GUP, holographic/self-regular principles or NCBHs, Frolov's result is probably not surprising: He spent a great effort to discover the G-lump which is smaller than the minimal mass and has no event horizon. Such an example is displayed for NCBH-like metric components g_{00} in the lower plot (blue line $\hat{=}$ "mass gap" gravitational potential).
